Phase II, randomized, double-blind, placebo-controlled study evaluating the effect of two different doses of palovarotene on new bone formation during and after a flare-up in individuals with FOP.	Open-label, Phase II extension study evaluating the long-term safety and efficacy of palovarotene on new bone formation during and after a flare-up.	Open-label, Phase II extension study evaluating dose exploration in individuals with FOP.	A non-interventional, longitudinal natural history study in people with FOP designed to understand disease progression and impact over time.
